

**Supplementary Figure 1**

**Supplementary Figure 1.** (A and B) Proteins isolated from the plasma-derived EVs were analyzed by western blot for the expression of Alix (specific EV marker), Tenascin and Vimentin.  $\beta$ -actin was used as loading reference. (C) Proteins levels as detected by the proteomic analyses. Note that while vimentin is absent from plasma-derived EVs, Tenascin is present at different levels in these EVs.
